

Chart language

19.09.2026 · A German report with an axis labelled 'Week' is not a German report.

What is it?

With 0.32.0 the tables and the prose spoke the language of the interface. The labels *inside* the charts came from a different module and stayed English. This completes the change.

How to use it

```
// portfolio report: as before
python -m portfolio portfolio.json \
    --output report.html --lang de

// build_reports on its own now has --lang too:
python -m build_reports IssueTimes.xlsx \
    --lang de --browser
```

In both GUIs without doing anything: the window passes its language on to the charts.

What follows now

- Axes: date, count, week, quarter, stage, total age, cycle days ...
- Chart titles and headers including the statistics line (min, Q1, mean, median ...)
- Curve names: inflow trend, outflow trend, trend (LOESS), CT median, target CT
- The cycle-time boundary declaration (AA1): 'Clock: first entry into <stage> → last entry into <stage>'
- The process-flow diagram legends
- The **month abbreviations** on the time axes

Two old defects fixed along the way

The **month abbreviations were hard-wired German** — in every report, including the English one — and were maintained **twice, in two modules**. The same held for 'Methode A' in the Flow Time chart title. Both now live once in the catalogue, per language.

The boundary drawn here

A catalogue key goes only to **what originates in code**. Everything arriving from the data — stage names from the workflow configuration, issue types, project keys — passes through untranslated. A stage is called what it is called in Jira; translating it would falsify someone else's configuration. The metric names remain governed by the SAFE/Global switch.
