

ART Depth

Evaluate Solutions & Portfolios down to ART level — including the ART & Teams analyses

What is it?

Until now a report looked only as deep as its own level: a solution compared its ARTs, a portfolio its solutions. But their pooled data no longer carries the individual ARTs' transitions — so the two workflow-bound „ART & Teams“ analyses (Process Flow) produced nothing at all at portfolio level. ART depth resolves the units down to the single ART: a portfolio then compares ARTs instead of solutions, and „which ART is the outlier?“ becomes answerable without opening every solution one by one.

How to use it

```
python -m portfolio portfolio.json --mode comparison --art-depth --output report.html
python -m portfolio portfolio.json --art-depth --conference pre-read.html
```

Or in the GUI: the checkbox „Evaluate down to ART level“ next to the mode selection in Solutions & Portfolios. It is stored with the configuration (report.art_depth) and applies to the report, the PDF and the conference pre-read alike.

What changes where

- Comparison mode: figures AND tables per ART; Process Flow and Process Flow Time join the defaults
- Pooled mode: pooled figures stay pooled — an „ART Detail“ table per ART is added
- Conference pre-read (VSC): Input 1 carries the same ART block — the granularity the ART teams themselves bring to the conference

Guardrails

Switched off nothing changes: same units, same default metrics, same file. ARTs are labelled „Solution · ART“ so equally named ARTs of two solutions do not silently merge. The ART rows live in their own table so outlier highlighting stays peer-to-peer. Snapshots and the delta briefing deliberately stay flat — otherwise changing labels would create drift noise. And ARTs times metrics multiplies the PDF page count, which is why the depth is a deliberate choice.
