

Colour legend & conference date

Field reports 19.09.2026 · A shaded cell that does not explain its colour is an assertion.

What is it?

Two things noticed while reading the conference pre-read. First: cells were shaded across every report without anything stating what the colours mean. Second: the header read 'Konferenz <today>' — and the one day on which the conference is not held is the day the pre-read is produced.

How to use it

```
// store the date in the configuration:
"report": {"conference_date": "2026-10-08", ...}

// or override it for a single run:
python -m portfolio portfolio.json \
    --conference preread.html --conference-date 2026-10-08
```

In the GUI: the 'Conference on' field in the Solutions & Portfolios window, with a calendar button, in all five languages. The field is optional — configurations without the key load unchanged.

What changes in the reports

- A colour key at the top of every page, before the first table: green on plan · blue committed · yellow watch · red critical · grey closed
- Under every shaded table a line with that table's own status words — needed because the same colour means different things per register: grey is 'done' for a dependency and 'accepted' for a ROAM risk
- Status scales in full (knowing that 'blocked' exists is part of reading an all-green table); single flags only when they actually occur
- The conference date with its remaining lead time in the header; without a date the header says so rather than showing one that claims a conference held today
- The pre-read's file name follows the conference date, not the day it was produced

Guard rails

The legend is derived from the colour tables in the code rather than written beside them: adding or recolouring a status changes the legend with it. Covered are the pre-read, the full report and the delta briefing; the PDF output draws its tables through a separate fill matrix and carries no legend yet. The stored date is also the span a later forecast to the conference would have to cover.
