Anomaly Hints and Explanation Layer (D4 step 2)

14 Oct 2026 · Statistics propose decision points, the staff agrees them, the AI explains triggered ones – cited, without recommendation.

What is it?

Which metric deserves a decision point? The series of your own stands knows better than any default: whatever drifts from its history is a candidate. And when a point triggers, the staff should read in two sentences what the stand shows about it – backed, not opined.

What it does

• --history FOLDER: median and MAD per metric over at least four stands; outstanding from 3 MAD; at most ten hints, the rest counted
• Hints are candidates for decision points – never alarms
• --narrate: per triggered point an AI explanation from the facts of its path, every statement cited, purpose d4_anomaly
• Triggered points lead the one-pager and sit in the row of their path family

Three decisions

Statistics do not alarm. An outlier is a finding, not an alarm. It becomes one only when the staff agrees a threshold – P4 rule 2.
Robust, not average. Median and MAD cannot be moved by a single outlier; a flat history (MAD 0) says nothing.
Explain with citations, never recommend. The explanation sees only the facts of the path and fails when uncited – the point stands, the explanation is missing.

How to use it

```
python -m portfolio solution.json --alarms points.md --history snapshots/
python -m portfolio solution.json --alarms points.md --narrate ollama --since-snapshot prev.json
```
