AI Drafts for the Conference Pre-Read

12 Oct 2026 · Five drafts, only on request, and the place is yours to choose – the paper that is read aloud stays deterministic.

What is it?

The conference pre-read bundles the four inputs of a Value-Stream Conference. It was deliberately AI-free: the paper of an already convened meeting, read aloud, not an exploration report. The AI checkbox next to it had no effect – since September the status line at least said so. Whether the pre-read should get drafts at all was the open decision D8.

The decision

• Place is selectable: the default is the editing file preread.html.narration.md next to the pre-read; on request the drafts sit labeled in the page itself (--conference-draft inline, GUI box)
• Scope: an introduction over all four inputs and one paragraph per input – five parts, each with its own contract
• Explicit only: --narrate together with --conference, in the GUI the existing AI checkbox; without the switch exactly as before

Three guard rails

Numbers only from the contract. Every part has a deterministic contract built from the same registers the pre-read shows. The numbers guard discards whatever is not in it.
Never persons. Owners, raisers and names are structurally absent from all five contracts – enforced by test.
One part fails, the pre-read stands. Missing parts are named in the editing file; the paper is always written.

How to use it

```
python -m portfolio cfg.json --conference preread.html --narrate
python -m portfolio cfg.json --conference preread.html --narrate --conference-draft inline
python -m portfolio cfg.json --conference preread.html --narrate mock
```
