

Multilingual Delivery

Feature D6 · Briefings and drafts in all five house languages — guarded, labeled, audited

What is it?

International solutions need the same picture in several languages. D6 delivers situational texts in de/en/ro/pt/fr — through the same llm framework as narration and executive summary. The numbers invariant is the perfect translation guard: every number in the translation must occur verbatim in the source, or it is discarded. Proper names (teams, ARTs, services) stay untranslated; the Art. 50 banner is written in the target language.

How to use it

```
# The editorial workflow: approve first, then fan out
python -m llm translate delta.narration.md --to en ro pt fr
```

```
# Inline with a run: deliver draft or briefing alongside
python -m portfolio --delta prev.json now.json --narrate \
    --translate en ro --output delta.html
```

A report run yields <output>.exec_summary.<lang>.md per target language, a delta run .narration.<lang>.md — without narration the deterministic briefing itself is translated (<lang>.md).

The rules

- Translate fully, add or drop nothing; keep the paragraph structure
- Numbers, dates and IDs (BR-2, EP-A9 ...) verbatim — machine-enforced
- Banner in the target language, audit purpose d6_translation, provider freely chosen (ollama local by default)

Guardrails

Every translation is a draft for human editing — the recommended path is 'edit and approve first, then fan out', so every language version descends from the approved wording (the manuals' lived practice).
