# Prompt Export instead of a Model Call

*13 Oct 2026 · The same prompt, the same document – only the model lives elsewhere.*

## What is it?

The AI layer drafts from deterministic contracts: executive summary, narration, red-team questions, translation, conference pre-read, harmonisation reading. So far a model had to be reachable – locally via Ollama or externally via API. Sometimes the right model sits on another machine, in another network, at another provider.

## What it does

• Provider 'export' in every provider box and every --narrate: calls no model
• Writes system prompt and contract to a file next to the output and to the clipboard – with instructions on how to feed the model and where the answer belongs
• The page carries a placeholder with the banner 'No model called'; the operator evidence records provider export, model none
• The answer goes into the draft file and is edited and approved like every AI draft

## Three decisions

**One provider, no special wiring.** Because the export runs through the same interface as ollama, claude and mock, it appears everywhere by itself – and stays there when the next AI step arrives.
**The contract remains the boundary.** What is exported is exactly what a model would be allowed to see: the deterministic contract without persons. No more goes to the clipboard than to the API.
**The file is the reliable channel.** The clipboard is convenient but not always there; the file always sits next to the output, in the folder of the operator evidence.

## How to use it

```
python -m portfolio cfg.json --output report.html --narrate export
python -m portfolio --delta prev.json now.json --output d.html --narrate export
python -m harmonisation C:\Lagebild\harmo --narrate export
```
