Solution Areas & Recurrence per Seam

13 Oct 2026 · Dynamic areas should be rare – when the same one comes back, it points at the cut, not at the teams.

What is it?

Solution areas are temporary collaborations across teams or value streams – useful when rare. When the same area keeps recurring at the same seam, that is not a team problem but an organisational or architectural anti-pattern. So far this was asserted; now it is counted.

What it does

• Lightweight register: topic as a short key, at least two participants, opened and closed dates
• The report groups per seam (the same participants) and counts the return of the same topic: twice highlighted, from three times on an EA signal
• Appears in the report, the conference pre-read (input 2), snapshot and delta briefing, the one-pager (decision point 'check the seam')
• Demo: Alpha-1 × Alpha-3 opens an area on the test-environment topic for the third time – the signal arrives in the delta

Three decisions

Seam = set of participants, topic = key. Recurrence counts only when both match. Two teams meeting for two different reasons are no pattern.
Two thresholds, no traffic light. Twice is a hint, three times a signal. What follows – change the cut, build an interface, merge teams – the tool does not say.
Teams, never persons. Participants are ARTs, teams or value streams; the register carries no names – the same aggregate boundary as everywhere in the situational picture.

How to use it

```
solution.json: "solution_areas": "registers/solution_areas.json"
python -m portfolio solution.json --output report.html
python -m portfolio portfolio.json --onepager page.html
```
