AI Literacy Record (Art. 4, R4)

17 Oct 2026 · The evidence knew which AI ran – now also whether the teams were enabled to use it.

What is it?

Art. 4 AI Act asks deployers for measures that ensure sufficient AI literacy; the supervisor recommends documenting them: kind, scope, participants, refreshed regularly. The content existed (competence field 7, curriculum module 7, tutorials) – the place to record that and when a team was trained was missing.

What it does

• ai_literacy.json: per measure date, title, kind, duration, participant count, teams, topics, module, materials, reference into the HR system
• python -m llm literacy: status per team (current, refresh due, no measure), measures table, offer per topic
• --audit: needs picture from the operator evidence – AI purposes used and the topics they presuppose; gaps as a hint
• Exit code 2 when a team is due – usable as a reminder in CI; --example writes a sample log

Three decisions

Operator level, no register in the picture. Training is operator data. The situational picture does not report on the qualification of its readers.
Teams and counts, no names. Person fields are refused; the reference points into the HR system (guardrail b).
An assessment, not legal advice. Art. 4 does not name the documentation explicitly; it is the supervisor's recommendation and, in doubt, the only proof.

How to use it

```
python -m llm literacy ai_literacy.json --example
python -m llm literacy ai_literacy.json --audit llm_audit.jsonl --output literacy.md
```
