Delta Briefing

Feature D2 (deterministic core) · What changed since the last state — and where is something tipping?

What is it?

A report shows a state; a situation service shows the change. The delta briefing compares two frozen report states (snapshots) of the same solution or portfolio picture and answers the leadership question 'what changed?' — without anyone laying two reports side by side.

How to use it

```
python -m portfolio portfolio.json --snapshot today.json
python -m portfolio --delta before.json today.json --output delta.html
# Demo: the scenario ships snapshot_prev/now.json ready to use
```

Or via the GUI: the Solutions & Portfolios window carries 'Save snapshot …' and 'Delta briefing …'; in the test-data generator, 'Open Delta Briefing' opens the demo briefing with one click.
--snapshot freezes metrics, source confidence and all seven governance registers into a small JSON (--as-of pins the observation date). --delta needs no config; output as an HTML page, a Markdown file (--output *.md), or text on the console.

What the briefing shows

- Metric deltas per unit and in total — at display precision, invisible changes are dropped
- Throughput in the period ('+59 items in 14 days')
- Confidence transitions per data source (e.g. medium → low)
- Per register: new, removed, status transitions — worsenings first and in red
- Newly overdue items: only genuine flips since the last state, no standing alarm
- 'No changes' is stated explicitly — silence is information

Guardrails

Everything deterministic — same snapshots, same briefing. The optional AI narration (D2 part 2, own one-pager) is deliberately separate: the LLM writes, it never calculates; the briefing's Markdown is its input contract. Owners are teams, not persons.
