AI Marker and Approval (R3)

17 Oct 2026 · The banner is for people, the marker for tools – and approval becomes a record, not a sentence.

What is it?

Every AI draft carried the visible notice (guardrail a). Nothing was machine-readable: a script could not tell an AI paragraph from deterministic text. And 'until approval' was a sentence – nothing recorded who approved and whether the text was edited.

What it does

• Marker sr-ai-draft/1 with the evidence fields: purpose, model, deployment class, prompt version, output hash, time, reviewed
• HTML: data attributes on the draft block, counter in head; Markdown: comment line before the banner – in every draft file
• python -m llm approve FILE --by TEAM: the hash shows whether the text was edited; marker to reviewed, banner becomes the approval line (Art. 50(4)), evidence record
• Unedited: exit code 3, only --as-is passes

Three decisions

One source. Marker, HTML block and Markdown head come from llm/guard.py; three copies and twelve sites became calls.
Approval now. Only with llm approve does 'until approval' become a state with team, date and evidence.
Deployer, not provider. No signature, no watermark – the code of practice addresses providers of generative systems. We label drafts, not publications.

How to use it

```
python -m llm approve report.html.exec_summary.md --by "Staff Alpha"
python -m llm approve report.html.exec_summary.md --show
```
