Harmonisation Score

12 Oct 2026 · Where to harmonise, and how deep – the finding comes from the tool, the judgement from the board.

What is it?

A group with several brands runs the same end-to-end process in several variants. Harmonise or not – and how deep? The Wolfsburg workshop (08/2026) described a harmonisation score for this: three dimensions (business value, transparency, IT/operations) × eight questions per process, feeding a board-level situational picture. The harmonisation module implements that structure – as a tool, not as a verdict.

What it does

• Question catalogue as data: 3 × 8 example questions shipped, your own questions go into the same JSON file
• Assessment per process: value 0–4 or “unknown”, each answer with an evidence level (documented, estimated, hearsay)
• Score per dimension 0–100 with a confidence traffic light; several assessments → median and spread
• Decision matrix as HTML in five languages, with the columns the board fills in: decision and depth
• GUI and command line, example workspace at a click

Three decisions

No proposal. The tool recommends neither what to harmonise nor how deep. It computes the finding; what follows, the board enters, and the matrix records it.
“Unknown” is an answer. It lowers the confidence, not the score. A situational picture that cannot show ignorance fakes certainty.
No overall score. Business value, transparency and IT/operations are three different things. Three numbers side by side are more honest than one that nets them.

How to use it

```
python -m harmonisation
python -m harmonisation C:\\Lagebild\\harmo --example --browser
python -m harmonisation C:\\Lagebild\\harmo --lang en
```
